About Me

I'm Alif, a UI/UX designer with a Computer Science background who enjoys turning complicated systems into interfaces that feel much less complicated. I like clean visuals, logical flows, and designs that developers won't secretly hate implementing. When I'm not moving pixels around in Figma, I'm usually figuring out how design, technology, and a suspicious amount of coffee can work better together.

FMIPA UGM

Benevolent White

Faculty Website Redesign

Redesigning a complex faculty website into a clearer, more modern, and easier-to-navigate digital experience

01

Project Overview

FMIPA UGM Benevolent White project simplifies a complex faculty website by organizing **scattered information**, creating **clearer navigation**, and delivering a **consistent** digital experience across pages and devices.

 UI Design

 Information Architecture

 Responsive Web Design

Problems and Solutions

The previous FMIPA UGM website had grown **hard to navigate**, visually **inconsistent**, and **difficult to maintain**. The redesign focused on **simplifying** the structure, **improving** content hierarchy, and creating a more **cohesive experience** across the site.

! Problems

Fragmented Information
Related content was spread across multiple pages, making important information harder to find.

Inconsistent Experience
Different pages lacked a unified visual structure, creating an experience that felt disconnected across the website.

Difficult to Maintain
The existing structure and technical dependencies made updating and maintaining the website less efficient.

Confusing Navigation
Overlapping destinations and unclear hierarchy made browsing the website more complicated than necessary.

! Solutions

Simplified Information Architecture
Related content was consolidated into clearer destinations, reducing unnecessary pages and navigation paths.

Clearer Navigation & Hierarchy
The navigation and content structure were reorganized to help users understand where they are and where to go next.

Unified Responsive Design
A consistent visual system, reusable components, and responsive layouts created a more cohesive experience across pages and devices.

Maintainable Web System
The redesigned experience was adapted to practical WordPress and Elementor constraints, making future content updates easier to manage.

02 Design Approach

Rather than starting directly with visual changes, I approached the redesign by first understanding the **existing content**, identifying areas of **unnecessary complexity**, and defining a **clearer structure** for the overall experience.

The process then moved from structure into exploration, interface design, and finement

01 Understand → 02 Structure → 03 Explore → 04 Design → 05 Refine

“ The redesign started with understanding how the website should work before deciding how it should look.

03 Project Timeline

This timeline outlines the **key phase** involved redesigning the FMIPA UGM website, from reviewing the **existing structure** to refining the **final interface system**

04

User Persona

We created this **user persona** to understand the needs, motivations, and **challenges** of prospective students, helping us design an intuitive website that delivers relevant information quickly and creates a strong first impression of FMIPA UGM

Nadia Putri Rahma
Prospective Undergraduate Student

	Age: 18 years		Location Yogyakarta, Indonesia
	Gender: Female		Goal Female
	Occupation: High School Student		Device: Mobile & Laptop

Background

Nadua is a final-year high school student exploring university options for her undergraduate studies. She often visits faculty websites to compare programs, facilities, and admission information. She needs a website that helps her quickly understand what FMIPA UGM offers without feeling overwhelmed by scattered content

Goals

1. Find clear information about study programs, academic opportunities, and campus life
2. Understand admissions pathways, requirements, and important dates without opening too many pages
3. Explore the faculty's strengths and get a strong first impression of FMIPA UGM

Challenges

1. Important information is often spread across multiple pages, making it difficult to compare options quickly
2. Long pages with unclear hierarchy make scanning content slower and more tiring
3. Inconsistent layouts can make the website feel less intuitive, especially for first-time visitors

05

Empathy Map

We created this **empathy map** to understand how Nadia **thinks**, **feels**, and **behaves** while exploring university options, helping us design a website that responds to her expectations and reduces **confusion** during her decision-making process

“ Says

I need clear information about study programs and admissions.

I don't want to open too many pages just to understand one thing.

I want to know what makes FMIPA UGM different.

⌘ Thinks

Wonders whether the website reflects the quality of the university.

Thinks comparing programs should feel simple and organized.

Worries about missing important admission details or deadlines.

✓ Does

Browses faculty websites and compares different programs.

Scans pages quickly instead of reading every paragraph.

Switches between mobile and laptop while researching options

Nadia Putri Rahma
Prospective Undergraduate Student

 Gender: Female	 Goal Female
 Occupation: High School Student	 Device: Mobile & Laptop

♥ Feels

Curious about future opportunities.

Overwhelmed when information feels scattered.

More confident when content is clear, structured, and easy to navigate.

This user flow maps how visitors navigate the new FMIPA UGM website based on their **main goals**, helping structure **clearer pathways** to relevant information and reducing **confusion** during exploration.

FMIPA UGM

Student Monitoring System

FMIPA Integrated Student Monitoring System

A role-based academic monitoring module for FMIPA UGM that detects delayed mandatory milestones, scopes student data by organizational responsibility, sends staged email warnings, and integrates directly into the faculty's existing Persuratan system.

02

Project Overview

An academic early-warning web application that helps staff identify students at risk based on missed mandatory academic milestones. The system combines role-based monitoring, dashboard statistics, automated email alerts, and exportable reports for faster follow-up.

Role-based Access

Secure access tailored to each role for focused monitoring and decision-making

Dashboard Statistics

Real-time visual insights into at-risk student counts across programs and criteria

Automated Alerts

Email notifications for at-risk cases to ensure timely follow-up and intervention

Excel Reporting

Exportable reports for deeper analysis, documentations, and stakeholder sharing

“How might we transform **academic data** into early warnings that enable faster and more **effective student support**?”

Design Process

User Persona

Dr. Andi Darmawan
Program Head

“ I need to identify academically troubled students quickly so i can take action before their academic problems escalate

 **Age:**
45 years

 **Location**
Yogyakarta, Indonesia

 **Tech Proficiency**
High

About **Andi**

Dr. Andi oversees academic performance in his study program. He needs clear visibility into students who miss mandatory academic agendas, falling behind in milestones, or require immediate follow-up. He works closely with academic staff and supervisors to support timed intervention.

Motivations

- Data driven decision making
- Faster Intervention
- Reliable and factual reports

Personality Traits

- Analytical
- Responsible
- Detail oriented

Goals

- Monitors Academically troubled students across the study program
- Ensure students complete mandatory agendas and milestones
- Use dashboard insights for academic decision-making
- Export reports for follow-up meetings and documentation

Frustrations

- Progress data is scattered and time consuming to consolidate
- Students are often detected too late
- Manual monitoring is inefficient
- Difficult to prioritize urgent cases

Design Implications

A clearer route from warning to action

01

Detect where attention is needed

Surface overdue academic milestones in a role-scoped overview, with monitoring access tailored to the user’s role.

Dashboard statistics + role-based access

From data to awareness

02

Understand the reason for a warning

Display the semester, missed agenda, and supervisor context together in the monitoring view

Student-level monitoring details

From indicator to context

03

Carry the information into follow-up

Support the next step with exportable reports and email notifications, not just a number on a chart

Excel reporting + email notifications

From insight to action

Monitoring Flow

A clearer process for a more supportive academic improvement

From a role-specific overview to a student-level warning and a practical follow-up

High-Fidelity Mockup

How the monitoring dashboards sits alongside the faculty’s existing indicators

Academic monitoring chart presented within the existing dashboard

01

Reporting period

Tahun Capaian: 2024 - Januari - Desember

The selected year provides the context for reading the dashboard

02

Flagged-student counts

Program Studi	Jumlah Mahasiswa Bermasalah
Matematika	42
Aktuaria	9
ELINS	22

The chart compares counts across programs; individual records explain each warning

Inside the faculty dashboard

The early-warning chart is one part of the faculty dashboard, not a replacement for it. I added the monitoring view alongside the existing indicators and retained the surrounding layout.

The charts shows where records have been flagged. Staff still need the warning list to understand the details of each use.

The overview starts the review

Case-Review Screen

The troubled student list keeps academic status and supervisor details in the same row

4			7	Proposal Skripsi		
5			7	Proposal Skripsi		
6			7	Proposal Skripsi		

The exports retains the monitoring fields for documentations and discussion outside the system

Output of the system

What the Excel report carries beyond the monitoring screen

The export function is useful because it keeps the context in another form of archiving. I included the semester, overdue academic milestone, and academic supervisor reference alongside the student details and credentials for further action

An exports act as a snapshot, not as a live case tracker.

01

Keep the report context

The record identifies the overdue milestone and its associated student details

Daftar Mahasiswa dengan Keterlambatan Agenda

Simpan Excel

NIM	Email Mahasiswa	Semester KHS	Agenda Terlambat	NIP Pembimbing
Redacted		8	Skripsi/TA/Semin ar Skripsi	Redacted

1

Go Back

Export the report in Excel

02

Retain the fields in Excel

All user can save the report for review, documentation, and further discussion with academic supervisors

Semester + academic milestone

Track the academic reason for the warning and attach it to the record

Supervisor reference

Retain the details needed when preparing such case discussion

Simplicity for reports

Reduce the complexity of the procedure from the initial way of data gathering
