PROFESSIONAL SUMMARY

Computer Science graduate with hands-on experience spanning software development, systems analysis, product design, and applied research. Delivered a production academic-monitoring module, restructured the information architecture of a public institutional website, and translated healthcare integration requirements into structured technical documentation. Experienced in working across requirements, design, implementation, data processing, testing, and production delivery.

EDUCATION

Bachelor of Computer Science | Universitas Gadjah Mada, Yogyakarta, Indonesia **2022 - 2026**

GPA: 3.58 / 4.00 | Graduated Aug 2026 | Hana Bank Foundation Scholarship Recipient

- Undergraduate thesis topic: Fine-Tuning Feed-Forward Networks only in PatchTST for Long-Horizon Financial Time-Series Forecasting; implemented the research model in C++ from first principles and reused the prior LSTM research implementation as a comparative baseline.

PROFESSIONAL EXPERIENCE

UI/UX Designer (Contract) | FMIPA UGM – Remote / Yogyakarta, Indonesia **May 2026 - Sep 2026**

- Redesigned and re-architected the information architecture of FMIPA UGM's official website, replacing a six-category global menu containing 60+ nested navigation labels with five primary destinations and structured content hubs while preserving access to core faculty information and services.
- Converted fragmented, category-driven content into task-oriented user flows, including restructuring the Student Affairs section from 13 menu-level choices into three need-based entry paths and organizing 46+ academic forms, procedures, and resources within a unified experience.
- Designed responsive interfaces in Figma and implemented approved layouts in WordPress using Gutenberg and Elementor across desktop, tablet, and mobile; completed three UAT cycles with lecturers and faculty leadership through final approval for staging deployment.

UI/UX Designer Intern | Datacakra - Remote / Jakarta, Indonesia **Feb 2026 - Apr 2026**

- Audited approximately 20 screens in RekMed, Datacakra's web-based electronic medical record and clinic-management product, mapping forms, fields, and workflows against SATUSEHAT requirements and producing structured documentation used for subsequent integration work.
- Designed the Smart Building real-time monitoring dashboard used in a CEO-led partnership pitch, visualizing multi-CCTV status alongside intrusion, crowd, and loitering alerts while extending the company's existing Figma design language.

Full-Stack Web Developer Intern | FMIPA UGM, Yogyakarta, Indonesia **Aug 2024 - Jan 2025**

- Independently developed and integrated an academic early-warning module into FMIPA UGM's existing Persuratan system, translating stakeholder requirements into rule-based monitoring flows for undergraduate, master's, and doctoral students and automating a previously manual process across approximately 1,500 student records.
- Developed the module using PHP, CodeIgniter 4, MySQL, JavaScript, HTML/CSS, and MVC architecture; developed multi-table SQL and helper logic across four core academic data sources to derive student semesters, study status, supervisor relationships, completed coursework, and mandatory-milestone eligibility from raw records.
- Implemented four levels of role-based data visibility for faculty leadership/admin, department heads, study-program heads, and academic supervisors, alongside program-level dashboard statistics, sortable monitoring tables, pagination, Excel reporting, and a logged two-stage email workflow for milestone reminders and overdue warnings.
- Designed and executed nine documented black-box test cases covering authentication, role-based filtering, dashboard statistics, pagination, report export, and email notifications, validating core workflows and identifying an export-pagination defect during functional testing before production hand-off.

TECHNICAL PROJECTS & RESEARCH

Government Application Beta Tester | Ministry of Energy and Mineral Resources, Yogyakarta, Indonesia **Sep 2024**

- Appointed by academic supervisor to support a focused six-hour black-box testing session on a confidential internal government application, identifying 24 functional and stability defects and documenting reproduction steps, expected-versus-actual behavior, and supporting evidence for developer follow-up.

Research Assistant (Project-based) | C++ | Foreign Exchange Rates 2000-2019 Dataset **Jul 2024 - Sep 2024**

- Engaged by Faizal Makhrus, S.Kom., M.Sc., Ph.D. to independently develop the experimental codebase for an LSTM-based foreign-exchange forecasting study, implementing recurrent gate/state computations, seven-step sliding-window forecasting, min-max preprocessing, MSE/MAE evaluation, numerical gradient estimation, and gradient-descent optimization from first principles in C++ using only the standard library.
